Implementation of Hardware Trojans

In a world of multinational production chains, hardware trojans inserted by untrusted third parties are an emerging threat for the security of integrated circuits.

In order to develop methods for hardware trojan detection, specimens of hardware trojans are needed, currently the variety of specimen available is very low.

During this thesis, you will implement a hardware trojan for an FPGA or ASIC circuit.

Prerequisites

The following list of prerequisites is neither complete nor binding, but shall give you an idea, what the topic is about.

- Sufficient knowledge in a High-Level Programming language such as python for designing an interface
- Basic Knowledge of a hardware description language such as vhdl or verilog for designing the trojan
- Knowledge in design of cryptographic algorithms / CPUs to know where a trojan might be injected
